

Phase 1 — Side Car Twin & Historical Archive

Peterbilt Atlantic Digital Twin · Hawkins / PACCAR · read-only sidecar architecture

EVEglyphDesign

Transcribed from the 2026-07-29 working sketch

1 · SYSTEMS OF RECORD

read-only — nothing is written back in Phase 1

Phase 1 scope — this week

Mirror what Hawkins already has. Find technical wins that do not ask staff to work harder. Scale Hawkins → Peterbilt → SAP as last-mile extension IP.

- Phase 1 — read-only flow
- Phase 2 — gated write-back

Reading the diagram

What each layer commits to, and what it deliberately does not.

1 • Systems of record

CDK, the legacy ASCII database and the PACCAR ePortal stay exactly as they are. The sidecar reads; it does not write, does not re-platform and does not require staff to change a process. The CDK extraction sequence inventories metadata first, then pulls three full months, using file export wherever an API is absent.

2 • Extraction and landing

A Postgres mirror carries the ASCII-safe schema already modelled at field level — 21 objects and 443 confidence-tagged fields, with generated Postgres/Snowflake DDL and a preflight validator. Undocumented ledger-side objects remain the first admin-access verification target. The historical archive is the backup lane the sketch names at the top of the page: financial reporting is tied to the middle month so the boundary months cannot distort it.

3 • Analytics and decision support

Variance work runs against 20-Group peer numbers rather than invented baselines; peer and Hawkins fields stay blank until Luke fills in Tim's figures. Parts availability reuses the dealer-parts-twin schema instead of inventing a second availability model. Decision support has to be able to say why an item ranks where it ranks.

4 • Output and the return path

The deliverable is a work list ordered by urgency and strategy. In Phase 1 it is a document the dealership can ignore without penalty. The dashed return path into CDK is Phase 2 and is gated: nothing writes back into a live dealer management system before the agreement is executed and the access question is settled.

Provenance

Transcribed from the operator's hand sketch of 29 July 2026 and reconciled against the held Peterbilt Atlantic Digital Twin record: the Luke reset defining a narrow read-only sidecar, the variance-worksheet intake covering spare parts and PACCAR ePortal integration, the CDK extraction sequence and field-level dictionary, the TELUS service-identity decision, and the agreement and access gates.
