

The Hawkins Twin as a Fundable Research Program

Best-available-fit evaluation of Canadian federal research and development instruments for a two-rail dealer-systems digital twin — PACCAR (Peterbilt Atlantic) and BRP (Extreme Torque Motorsports)

PREPARED BY	EVEglyph Design
OPERATOR	Dany Thériault
FOR	Tobias · Tim Hawkins · Luke Weatherby · Craig Allen
SUBJECT	Hawkins Twin — PACCAR & BRP telemetry and inventory twin

01 Determination

The answer to the question asked, before the reasoning that supports it.

BEST AVAILABLE FIT

There is no single best program. The Hawkins twin fits a three-instrument stack, and the instruments have to be sequenced, because one of them can only fund work that has not started and another can only reach work already done.

Primary — NRC IRAP. Non-repayable contribution, typically 60–80% of Canadian technical salaries and arm's-length Canadian subcontractor fees, advisor-led, paid against a project plan as the work happens ([NRC IRAP 2026 funding guide](#)). This is the correct home for the next unresolved uncertainty in the twin.

Base — SR&ED. The 35% enhanced refundable investment tax credit, whose annual expenditure limit was raised from \$3M to \$6M for taxation years beginning on or after 16 December 2024 — up to \$2.1M refundable per year (KPMG on the SR&ED reforms). This is the only instrument that reaches work already performed on the parts twin. It is claimed retroactively on Form T661, and the 18-month filing deadline is absolute ([R&D funding Canada 2026](#)).

Scale lane — ACOA, Regional Economic Growth through Innovation (Business Scale-up and Productivity). Atlantic-specific, and Hawkins is in New Brunswick. Recent New Brunswick BSP agreements are visible in the public grants record ([Open Government grants portal](#)), and the program funds incorporated companies as well as other enterprise forms ([ACOA REGI](#)). This is where the proven twin scales across Tim's 20 Group and the powersports network.

THE ONE GATE THAT DECIDES EVERYTHING

Neither IRAP nor SR&ED cares much about portability. Both care intensely about **who the claimant is and where the labour was performed**. IRAP requires an incorporated, for-profit Canadian SME under 500 employees, operating in Canada, with the R&D performed in Canada, co-funding capacity, and **work not yet begun** ([IRAP eligibility](#)). SR&ED requires a taxable entity in Canada and work carried on in Canada ([CRA SR&ED program](#)). An EVEglyphDesign operator resident in Kansas cannot be the claimant, and US-performed labour is not claimable labour. Section 07 sets out the two structures that solve this.

Ranked evaluation

#	INSTRUMENT	WHAT IT PAYS	FIT TO THE HAWKINS TWIN	VERDICT
1	NRC IRAP National Research Council	60–80% of Canadian technical salaries and arm's-length Canadian subcontractors; non-repayable; no published ceiling, first-time awards commonly \$75K–\$200K	Highest fit. The twin is exactly what IRAP funds: a technology-based process innovation by an SME with a commercialization path. A free Industrial Technology Advisor assesses eligibility before any filing, which de-risks the whole file. Constraint: cannot fund work already begun — the project must be scoped on the unresolved uncertainties (U3, U5), not on the parts twin already built.	Pursue first. Advisor call is free.

#	INSTRUMENT	WHAT IT PAYS	FIT TO THE HAWKINS TWIN	VERDICT
2	SR&ED Canada Revenue Agency	35% enhanced refundable ITC on up to \$6M of qualified expenditure (\$2.1M/yr); capital expenditure incentives restored; New Brunswick adds a 15% refundable provincial credit	High fit, and uniquely retroactive. The schema work, the two adapters, the rebalance algorithm, and the write-safe interoperation problem are textbook experimental development in software. Stacks with IRAP: IRAP reduces the SR&ED base but does not eliminate it.	Claim for the current fiscal year. Watch the 18-month wall.
3	ACOA — REGI / Business Scale-up and Productivity	Interest-free repayable and, for some recipients, non-repayable contributions toward scaling, productivity and market entry	Good fit for Phase B — taking the proven twin from Hawkins to the 20 Group at cost, and to the three powersports sites. Not a research instrument; do not use it to fund the uncertainty. Use it to fund the reach.	Open the conversation in parallel, fund it later.
4	NRC IRAP clean-technology stream	Commonly \$100K–\$500K for first-time applicants; larger multi-year demonstrations reach \$1M+	Conditional fit. Requires TRL 5 or better and a specific, measurable, scalable environmental benefit — vague green claims are rejected. The measurable here is asset-life extension and parts remanufacture: the Peterbilt EV line (579EV, 520EV, 220EV) is already in the inventory, and maintenance and recycling are where the grid argument actually lives.	Secondary lane once parts-life data exists.
5	Strategic Innovation Fund and similar large-scale federal instruments	Large contributions for major industrial projects	Poor fit at present scale. These instruments expect capital intensity and consortium weight the twin does not yet carry. Revisit only after the 20 Group cohort is contracted.	Not now.

02 The portability premise, corrected

Vendor-independence is not a federal eligibility rule. It is the strongest evidence available that this work is advancement rather than adoption — which is a more useful thing for it to be.

The operating premise brought to this evaluation was that the Canadian federal government requires software work to be completely portable and non-dependent on an existing platform, and that this requirement is what historically locked out independent developers. That premise is worth restating accurately, because the accurate version is more useful than the assumed one.

No federal program publishes a portability criterion. What CRA actually applies is a three-part test: the work must have faced scientific or technological uncertainty that a competent professional could not resolve from available knowledge; it must have proceeded by systematic investigation; and it must have sought technological advancement beyond the claimant's own company. Routine debugging, standard methods, interface changes, and market research are excluded ([SR&ED eligibility 2026](#)). Practitioners compress the same test into five questions, the first of which is simply whether standard practice was falling short ([EY, five questions](#)). IRAP applies a parallel test: genuine technological uncertainty plus a credible commercialization pathway, and it explicitly does not fund routine engineering or feature additions to existing products ([IRAP eligibility 2026](#)).

What portability actually defeats is the single most common rejection of software claims. Software files fail when the reviewer characterises the work as configuring, integrating, or extending commercial platforms — work that is skilled but not uncertain. Every claim that a dealer twin is "just an integration project" is answered by one

artifact already in the repository: `docs/sovereignty.md` in `eve-dealer-parts-twin`, which sets out the exit path for every adapter, states that the schema uses SAP-shape names but no SAP HANA licence, no CDK-proprietary SQL, no Fortellis-exclusive schema and no PACCAR-specific database, and declares that the twin outlives the franchise. That is not a philosophical position. It is a testable engineering property, and Section 05 turns it into a claimable uncertainty.

Second, portability answers the question programs do ask about IP and commercialization. IRAP will not fund a project whose commercial outcome depends on a third party's continued permission. A twin whose schema, movement history, rebalancing algorithm and KPI definitions are owned outright — documented, not asserted — has a commercialization pathway a reviewer can verify. A platform-dependent build does not.

THE INSTRUCTION THAT FOLLOWS

Keep the portability doctrine exactly as it is written. **File it as evidence, not as the claim.** The claim is technological advancement across two unrelated OEM backbones. Portability is how we prove the advancement is generalizable rather than local — and it converts a governance conviction into a measurable experimental result.

03 The two-rail advancement thesis

PACCAR and BRP under one owner, in one province, with opposite seasonality. This is the asset in the file, and it is the thing to max out.

CRA requires advancement of knowledge beyond the claimant's own company. This is where most single-customer digital twin projects die: an inventory improvement at one dealership is a business-specific efficiency gain, and efficiency gains are explicitly non-qualifying. The Hawkins context escapes that trap for a reason that is structural rather than rhetorical.

Rail A — PACCAR

Peterbilt Atlantic operates nine centres against two systems. The OEM backbone is PACCAR Parts, running SAP ECC moving to S/4HANA as a **single enterprise instance at PACCAR headquarters in Renton, Washington**; the dealer touchpoint is PACCAR ePortal plus EDI and API surfaces carrying transactions 204, 210, 214 and 990; fulfilment flows through PACCAR Parts Distribution Centers including Renton, Louisville, Mississauga and Las Vegas; and Managed Dealer Inventory pushes a daily consumption-based stock recommendation to each dealer site. Returns run through Synchron SLM. The dealer-side DMS is CDK Drive, whose modern integration surface is CDK Fortellis. All of this is established in `eve-dealer-parts-twin/docs/current-state.md`, with the decisive finding recorded there: the nine sites do not each hold an SAP install, they hold a login to the same PACCAR instance and receive a per-plant MDI feed. **MDI optimises the distribution-centre-to-dealer refill loop. It does not optimise dealer-to-dealer balance.** That gap is the origin of the whole research program.

Because PACCAR owns both Peterbilt and Kenworth, and every dealer in both networks runs the same parts backbone, anything proven at Hawkins transfers across the wider PACCAR dealer world with almost no rework — the argument already recorded in `eve-hawkins-truck-mart/commercial/first-of-its-kind-and-scale-plan.md`.

Rail B — BRP

Extreme Torque Motorsports is described on the Peterbilt Atlantic community page as the sister powersports company; both entities are controlled by Timothy Hawkins and share proximity on Greenview Drive in Hanwell, New Brunswick. Extreme Torque is a full-service powersports dealership across **three New Brunswick locations — Moncton, Fredericton (Hanwell) and Woodstock (Jacksonville)** — carrying Can-Am, Sea-Doo, Ski-Doo, Lynx and Manitou, with OEM parts and a full service shop. This is recorded in `peterbilt-atlantic-public-source/company/affiliated_entities.md` .

Why the pair is the claim

PROPERTY	CONSEQUENCE FOR THE FUNDING FILE
Two structurally unrelated OEM backbones	A single vendor-neutral material master that holds both PACCAR supersession chains and BRP part numbering is knowledge that generalizes past one firm. This is the direct answer to the advancement-beyond-the-company test.
One owner, one province	Twelve New Brunswick locations under common control means one consent conversation, one jurisdiction, one fiscal structure, and no inter-company data-sharing obstacle. Multi-OEM test beds normally require competitors to cooperate. Here they do not.
Opposite demand seasonality	Snowmobile demand is winter-peaked, watercraft summer-peaked, and linehaul truck parts consumption is broadly continuous and duty-cycle driven. A reorder algorithm that holds across signatures in opposite phase is a genuine technological uncertainty, not a configuration exercise. This is the strongest single sentence available for a T661 narrative.
Telemetry already present on the hard asset	SmartLINQ remote diagnostics is factory-standard on Peterbilt models 579, 589, 567 and 548 and across the EV line — 579EV, 520EV and 220EV — with fault-code streaming, remote parameter updates and predictive maintenance flags; FleetRight and PACCAR Solutions carry the fleet and drivetrain data. The trucks already talk. Recorded in <code>peterbilt-atlantic-public-source/telemetry_appendix/README.md</code> .
Cultural adoption asset	Not an eligibility factor, but a real commercialization factor that reviewers respond to: the premium truck brand carries recognition that a schema does not. Adoption risk is the quiet reason technology grants fail. Here it is unusually low.

04 Repository evidence map

Reverse-engineering the file from what has already been committed. Each criterion, the artifact that satisfies it, and the honest gap where none exists yet.

A symmetric search across the five Hawkins-lane repositories was run before any external retrieval. The result is that most of the evidentiary burden is already carried by committed work. What follows is the map, including where it is thin.

CRITERION	ARTIFACT ALREADY IN THE REPOSITORY	ASSESSMENT AND GAP
Technological uncertainty	eve-dealer-parts-twin/docs/current-state.md — two-rail analysis; the MDI limitation; the single-PACCAR-instance finding; CDK store-code structure	Strong. Names the specific limitation of the incumbent method, which is exactly the shape CRA wants. No rewrite needed.
Systematic investigation	schema/ — eight SAP-shape tables (MARA, MARC, MARD, MBEW, MATDOC, MVKE, MARM, MFRPN) plus kpi_views.sql ; adapters/paccar/ ingest.py ; adapters/cdk/ingest.py ; algorithms/rebalance.py ; seed/ build_seed.py	Artifacts strong, record thin. Commit history proves iteration but not hypothesis. Gap G3.
Advancement beyond the company	docs/sovereignty.md — exit path per adapter, what we control forever, what we refuse to lock into; schema/README.md ; eve-hawkins-truck-mart/commercial/inventory-twin-spec.md	Strong, and the highest-value document in the file. Reframe from posture to result: see U5.
Commercialization pathway (IRAP)	commercial/first-of-its-kind-and-scale-plan.md — prove once at Hawkins, then deliver at cost to the ready members of Tim's 20 Group; commercial/roadmap.md ; commercial/rollout-and-funding-playbook.md ; commercial/peterbilt-atlantic-saas-products-and-tools.md	Strong on reach, weak on numbers. IRAP wants a costed plan. Gap G5. Note also that an at-cost, non-profit posture must be stated carefully: IRAP funds profit-oriented businesses and excludes non-profits.
Second vertical / generalizability	peterbilt-atlantic-public-source/company/affiliated_entities.md — Extreme Torque, three NB sites, Can-Am / Sea-Doo / Ski-Doo / Lynx / Manitou	Present but unexploited. The BRP rail exists in the record as company background, not as research scope. Promoting it is the single highest-leverage edit available.
Telemetry basis	telemetry_appendix/README.md — SmartLINQ, FleetRight, PACCAR Solutions, the EV line, the dealer-as-sovereign framing	Strong. Already written as a sketch for reaction rather than a pitch, which is the correct posture for an advisor meeting.
Consent and vendor compliance	hawkins-twin-compliance-vault — vendor_terms/ , signoffs/ , luke_weatherby/ ; and in hawkins-twin-platform , the Module 1 intake sequence requiring signed user agreements before mirroring	Structure exists, contents do not. The vault currently holds READMEs. Gap G4.
Contemporaneous governance record	hawkins-twin-platform/ledger/ — sins/ , drift/ , events/	A real asset, wrongly aimed. It records governance defects, not technical experiments. The same discipline pointed at engineering questions becomes the SR&ED laboratory notebook. Gap G3.
Extract precedent and delivery form	platform/2026-07-17_Discovery_Architecture_Extract.pdf ; platform/2026-07-17_Discovery_Business_Brief.pdf ; the composite leave-behind; the next-steps executive dashboard	Strong. Watermarked, hashed extract form is already established, so submission packaging is a known process rather than new work.

CRITERION	ARTIFACT ALREADY IN THE REPOSITORY	ASSESSMENT AND GAP
Prior funding analysis	commercial/rollout-and-funding-playbook.md (1 July 2026) — research-tool framing, the NB stacking sequence, ITA-first	Correct in strategy and confirmed by this evaluation. Superseded in two respects: the enhanced SR&ED limit is now \$6M, not \$3M, and the claimant-entity question was not resolved.

05 Claimable technological uncertainties

Five, written in the language a reviewer applies. U1, U2 and U4 are largely performed and belong to SR&ED. U3 and U5 are unresolved and belong to IRAP.

U1 Cross-OEM parts-master reconciliation without a shared identifier. Can a single vendor-neutral material master hold PACCAR supersession chains and BRP part numbering such that point-in-time inventory and cost are losslessly reconstructable, when neither OEM exposes a stable cross-reference and the manufacturer-part-number relation alone is insufficient? The outcome was not knowable in advance from published documentation of either backbone. Instrument: SR&ED. Evidence: `schema/` , `adapters/` .

U2 Local reorder determination under withdrawn OEM recommendation. Can a dealer-side reorder point derived solely from local movement history match or exceed the OEM's consumption-based recommendation across twelve sites whose demand signatures are in opposite seasonal phase, given that the OEM recommendation is optimised for a different objective — refill of the dealer from the distribution centre, not balance between dealers? Instrument: SR&ED. Evidence: `algorithms/rebalance.py` , `schema/matdoc.sql` .

U3 Telemetry-to-consumption causal linkage with usable lead time. Can fault-code and duty-cycle streams available to the dealer be linked to parts consumption with sufficient lead time and confidence to change stocking behaviour, when the dealer receives the events but not the OEM's predictive model? This is unresolved and is the correct core of an IRAP project. Instrument: IRAP.

U4 Write-safe convergence with a system of record. Can a twin maintain convergence with a dealer management system and an OEM portal through read-only ingest plus human-approved write gates, without divergence under concurrent edits, when both upstream systems are architected on the assumption that they are authoritative? No vendor pattern exists for this. Instrument: SR&ED, extending into IRAP.

U5 Portability as a measured property rather than a stated one. Can adapter substitution — dealer management system replaced, or the entire PACCAR rail swapped for the BRP rail — be achieved with no schema migration and no loss of history, and can that be demonstrated experimentally rather than asserted architecturally? This converts the sovereignty doctrine into a testable hypothesis with a measurable result, and it is the uncertainty most specific to this program. Nobody in the dealer-systems segment has published a result here. Instrument: IRAP, headline claim.

WHY U5 MATTERS MORE THAN IT LOOKS

U5 is the reconciliation between the operating conviction and the funding requirement. The conviction is that work must be portable and the operator must remain sovereign. The requirement is that the work must advance knowledge beyond the firm. U5 is both at once: it takes portability out of the realm of principle and makes it a quantity — adapters substituted, migrations required, history preserved — which is precisely what turns a governance stance into experimental development.

06 The last-mile argument

Why the public-benefit narrative should be stated plainly, and where it belongs in the file.

Thirty years of global systems integration produced improvements that reduced real human cost, and attribution for those improvements went to the large enterprise clients who commissioned them. That is simply what the contract environment was. The consequence is that the individual practitioner never accumulated the record that funding programs read as track record, which is a structural rather than a personal disadvantage.

The work now is the last mile of enterprise consulting: taking the capabilities that were only ever affordable to large enterprises — asset registers, condition monitoring, maintenance history, lifecycle planning, the disciplines developed for plant and equipment — and making them available at the level of the individual operator, and eventually the individual person. When a body, a truck, or a dealership is treated as an asset with a durable record and a maintainable condition, the same engineering that keeps a generating station running becomes available to a single owner. The twelve New Brunswick locations, two OEM rails, and one owner in this file are the first instance of that at commercial scale.

Where this belongs. Not in the T661 narrative — CRA reads technical, not moral, argument, and public benefit will not carry a claim. It belongs in the IRAP advisor conversation, where economic and social outcome is explicitly assessed; in the ACOA file, where regional benefit is the point; and in the clean-technology framing, where asset-life extension and remanufacture are the measurable form of the same conviction. State it once, plainly, and let the schema do the rest of the talking.

07 Applicant architecture

The claimant question, which is the only genuinely blocking issue in this evaluation.

Both primary instruments require a Canadian claimant and Canadian-performed work. EVEglyphDesign's operator is resident in Kansas. Neither the operator personally nor a US entity can be the claimant of record, and labour performed outside Canada is not claimable labour. Two structures resolve this; they are not equally good.

STRUCTURE	MECHANISM	TRADE-OFF
A — Hawkins as claimant	The New Brunswick operating company (Hawkins Truck Mart / Peterbilt Atlantic, or Extreme Torque Motorsports) is the incorporated Canadian SME that files. The twin is an internal research program on its own operations. EVEglyphDesign contributes design and architecture.	Fastest. Claimant exists today, is incorporated in Canada, is for-profit, is comfortably under 500 employees, and holds both OEM rails. But EVEglyphDesign's non-Canadian labour is not claimable, and IRAP cost-share on subcontractors is limited to arm's-length Canadian service providers. Retained IP must be settled in writing before filing.
B — a New Brunswick EVEglyphDesign entity as claimant	Incorporate a Canadian for-profit corporation in New Brunswick as the technology developer. It employs the Canadian-resident technical staff, holds the twin IP, and Hawkins becomes the industrial host and first customer.	Strongest long-run. Puts the claim where the technology and the future revenue sit, makes the twin the funded product rather than a client's internal project, and preserves the ability to sell across the 20 Group and the PACCAR network. Requires incorporation, a Canadian-resident technical payroll, and demonstrated co-funding capacity.

Recommendation: B, with A as the bridge. Open the advisor relationship immediately under the existing New Brunswick operating company so the file starts moving, and incorporate the New Brunswick technology entity in parallel so that the IRAP project — scoped on U3 and U5 — is filed by the entity that should own the result. The determining variable is where Canadian-resident technical labour sits, so **Tobias's residency and employment relationship must be established before either path is committed.** If Tobias is Canadian-resident, structure B becomes materially easier and should be moved on without delay.

08 Gaps to close before filing

Stated without softening. Two are blocking.

G1 BLOCKING No Canadian claimant entity is designated. Until Section 07 is decided, nothing else can be filed. Cost to close: a decision and, for structure B, an incorporation.

G2 BLOCKING FOR IRAP Work already begun cannot be funded by IRAP. The parts twin as built must be presented as capability and prior art, never as project scope. The IRAP project is U3 and U5, which have not started. Presenting the completed twin as the project is the fastest way to lose the file. SR&ED is unaffected — it is retroactive by design.

G3 No dated technical experiment log. Open `ledger/experiments/` in `hawkins-twin-platform` now, with one entry per attempt: date, hypothesis, method, result, what remained unknown, what was tried next. The ledger discipline already exists for governance defects; point it at engineering. Contemporaneous documentation is the backbone of any claim and cannot be reconstructed later without weakening it.

G4 The compliance vault is empty of contents. Vendor terms for the dealer management system and the OEM portal, and the signed user agreements from the Module 1 intake, must be in the vault before ingest is defensible to either a reviewer or a vendor.

G5 No costed project plan. IRAP funds a plan: named technical staff, hours, rates, Canadian-resident split, subcontractors, milestones, and the co-funding share the applicant carries. None of this exists yet in the repository.

G6 The SR&ED filing wall is unmapped. Determine the fiscal year-end of the intended claimant and back-calculate the 18-month Form T661 deadline. Missing it forfeits the claim permanently, with no appeal. File even where eligibility is uncertain.

G7 The at-cost, non-profit posture needs careful wording. The plan of record offers the twin to the 20 Group at cost, and describes EVEglyphDesign's part as non-profit. IRAP funds profit-oriented incorporated businesses and excludes non-profits. The intent is honourable and should be kept, but the claimant must be a for-profit corporation and the wording in the submitted plan must not read as a non-profit application.

G8 The BRP rail is not yet research scope. It exists in the record as sister-company background. Promote it: one specification document naming the BRP rail as the second adapter target and the generalizability test. This is the cheapest high-value edit in the entire file.

09 Sequence

Cheapest and most reversible actions first. The first two cost nothing but a phone call.

WINDOW	ACTION	DETAIL
Now — free	Engage an NRC Industrial Technology Advisor	Call NRC IRAP at 1-877-994-4727 to be connected with a regional advisor; a Fredericton or Moncton advisor covers this territory. Advisory is free, the assessment is informal, and a positive read materially improves the later application (IRAP application steps). Do this before filing anything anywhere.
Now — free	Open the experiment ledger	Close G3 the same week. Every day without it is evidence permanently lost.
Week 1–2	Decide the claimant	Close G1. Establish Tobias's residency and role. If structure B, begin New Brunswick incorporation.
Week 2–3	Advisor meeting	Present the two-rail thesis and the unresolved uncertainties. Bring the repository as evidence of capability. Do not present the completed parts twin as the proposed project — G2.
Week 3–4	Promote the BRP rail; fill the vault	Close G8 and G4. One specification document, and the signed agreements from the Module 1 intake.
Week 4–6	Costed IRAP plan on U3 and U5	Close G5. Milestones, named Canadian-resident labour, co-funding share.
Parallel	Open the ACOA conversation	Contact the nearest ACOA office to discuss the scale-up project before submitting an application for financial assistance; the general line is 1-888-576-4444, Atlantic time (ACOA REGI). Frame Phase B — reach across the 20 Group and the powersports sites — not the research.
By fiscal filing	SR&ED T661 on U1, U2 and U4	Close G6 first. Add the New Brunswick 15% refundable provincial credit to the federal claim.
Later	Clean-technology lane	Once parts-life and remanufacture data accumulate, revisit the clean-technology stream with a measured environmental benefit rather than a stated one.

ONE-LINE SUMMARY FOR TOBIAS

IRAP for what we have not built yet, SR&ED for what we already built, ACOA for spreading it — and none of it moves until a New Brunswick corporation is named as the claimant and a dated experiment log is open. The two OEM rails under one owner are the reason this file is fundable at all; put BRP in scope.

Scope and limits. This is an evaluation of programme fit against published criteria and the committed repository record. It is not tax advice, and it is not a filing. Programme parameters change: the SR&ED enhanced expenditure limit, provincial credit rates, and IRAP cost-share bands must be re-verified against the administering agency at the moment of filing. Award ranges cited from advisory publishers are indicative of practice, not entitlements. Every figure and criterion above is traceable to a source in Section 10; where the repository record and this evaluation disagree, the repository is the older document and this one supersedes it on the two points named in Section 04.
